

## Realize the Full Potential of SAP with BI Office

With new functionality from Pyramid Analytics, organizations can now leverage the full value of their SAP data using best-in-class enterprise business intelligence from Pyramid Analytics—without sacrificing security or control.

SAP is one of the premier providers of enterprise software to manage business operations. Thousands of organizations rely on their technologies to support their everyday data needs. Historically, some have struggled to integrate this data into an analytics solution that allows end-users to meaningfully integrate it with other data sources without IT assistance.

**With BI Office, now they can.** BI Office allows organizations to maximize their SAP investment, make complex data simple, and improve manageability—all within a complete self-service analytics environment. BI Office can be deployed as either a cloud or on-premise platform to meet your organization's specific needs.

**Make your SAP more powerful** by connecting it to BI Office using an SAP®-Certified Connector and integrating it with other data in a governed, self-service environment.

“ This addition ... will allow us to offer an alternative approach to access our core ERP data, helping us gain exceptional insight and understanding across our business. ”

*Joanna McGurk, Voith*

**New functionality in BI Office allows organizations to bring their SAP data together in a secure, on-premise or cloud business intelligence environment.** Users can optimize complicated SAP data sets and integrate them with data from other sources, giving users the right tools and better data to make data-driven decisions.

➤ **Gain unparalleled visibility into your business** BI Office reveals hidden insights and presents SAP data so all types of users can see it, understand it, and make better business decisions.

➤ **Connect to any SAP data source** With an intuitive interface, business users can make their own data models using Theobald, an industry-leading SAP®-certified connector, to merge SAP data with non-SAP data and control when the data refreshes.

➤ **Curate data models in a governed and secured framework** BI Office provides an intuitive, on-premise administrative framework for IT to make sanctioned content available using an SAP®-certified connector for the right users to see and explore.

➤ **Integrate all of your SAP data with other sources** BI Office provides a single analytics environment where users can integrate content from disparate sources (including SAP), apply universal interactions, and change context on the fly.

*Business users can build their own data models from SAP sources and schedule when the data refreshes.*

**Share content and context across your SAP data** BI Office provides a platform for users to share and re-use content and business logic. It also provides content recommendations and conversation threading to expose important insights and interactions.

**Increase the return on your SAP investments** When paired with a modern platform tool like BI Office, organizations are

able to increase the value of their current SAP investments and make their data more powerful than ever before.

**Create an integrated end-to-end analytics workflow** BI Office delivers end-to-end analytics that widens end-user adoption without sacrificing IT governance or administrative control.

### How the SAP Integration Works
